NOISELESS, POWDERLESS GUN FIRES 100 SHOTS A SECOND

Without any sound except the patter of bullets as they made holes through targets constructed of pine boards, 100 shots a second were discharged from a noiseless and powderless gun in the loft of the Standard Meter Company's factory.

At the demonstration, which was made by the inventor of the gun, Frederick Bangerter, a mechanical engineer, were several mechanical experts, who had been especially invited to witness the test.

No one was permitted to inspect the gun, which was completely hidden by a wooden enclosure constructed around it in the corner of the loft.

DIAGRAM SHOWING THE NEW POWDERLESS GUN AND HOW IT RIDDLED THREE TARGETS.

Before the demonstration began Mr. Bangerter explained that his invention does not require explosives of any kind and that compressed air has nothing to do with the discharge of the bullets. The mechanism, he explained, is simple—so simple, in fact, that anyone with a bent for machinery could understand it if once permitted to examine the gun.

Power from a seven-horsepower electric motor supplied the propelling force which discharged the bullets. This power was transmitted by a belt which ran from the flywheel of the motor through an opening in the case—ment and over another wheel which was connected with the gun's mechanism.

No sound except the whirl of the wheel came from the gun enclosure when the power was turned on.

For ten seconds the bullets were fed into the gun. The spectators, crouching behind a wooden partition that had been erected to protect them from rebounding shots, saw the target, which was about ten feet square and sixty feet away, riddled with holes within a second after the rain of steel began to rattle on the half-inch pine boards. The bullets were three-eighths of an inch in diameter.—Boston Post.

Book For Manifolding.

Those who are compelled to make frequent use of manifold paper are of the opinion that it is possessed of impish traits. The paper is heavily weighted with a composition of carbon, so that the sheet slips and slides in a way which is extremely tantalizing. Then, again, it is difficult to get it always in place just exactly in the

right way, so that an imperfect copy is often the result.

A new process has been brought out recently which makes such mistakes less liable to happen and makes the handling of the carbon paper much easier. The innovation consists of making a paper of such a quality that one side may be written on for the purpose of making a record, while the other side has a coating of the carbon composition for making the duplicate on another sheet. As the book is bound a plain sheet of paper is slipped between two of these combination sheets, and the act of making a copy is almost automatic.—Washington Star.

How to Prevent Long Speeches.

The Japanese manage their dinners in much better fashion than do the Occidentals. They have the speeches first and the food afterward.—Chicago Tribune.

The blind population of Great Britain is about 40,000.

The Right Sort of Wife.

An Atchison man recently refused a proposal of marriage. "I like you," he said to the girl, "but you have too many friends. There would be too many at our wedding, for you would be afraid not to invite them all, and your many friends wouldn't be satisfied unless they made fools of us by playing some kind of crazy pranks on us when we started on our wedding journey. You have so many friends that we would get all kinds of wedding presents that we don't want, and would be kept poor in future trying to pay back when the donors got married. You are nice, and I like you, but what I am looking for in a wife is a woman who is friendless."—Atchison Globe.

Overlooked.

Auntie—"Tommy, I put three pies in here yesterday, and now there is only one. How is that?"

Tommy—"Please, it was so dark, auntie, I didn't see that one!"—Punch.

Some one asked Max Nordau to define the difference between genius and insanity. "Well," said the author of "Degeneration," "the lunatic is, at least, sure of his board and clothes."
